DOI. 10.21931/RB/2021.06.04.21

Abstract: In most underdeveloped nations, traditional medicine, including herbal treatment, is still widely used. Due to the growth of antibiotic resistance, this study aims to use pepper as an anti-bacterial as alternative to antibiotics. Pepper is one of the most important plants used as a medicine for a long time in various countries and civilizations. This study aims to use pepper as an anti-bacterial in alternative to antibiotics. The current study included the inhibitory efficacy of aqueous and alcoholic red pepper extract on seven bacterial isolates: *Staphylococcus aureus*, *Streptococcus spp*, *Escherichia coli*, *Klebsiella spp*, *Salmonella spp*, *Pseudomonas aeruginosa*, *Proteus spp*. These isolates were isolated from different pathologies and regions, and they were diagnosed according to the site of infection. Several antibiotics were also used as a standard control sample for germs. This study shows that the highest inhibitory Effect against *E. coli* bacterium, as the average inhibition diameter was about 16.5 mm, and it is an excellent inhibitory when compared to the antagonist’s gentamicin and nitrofurantoin as it showed good inhibitory efficacy against the bacteria such as *S. aureus*, *P. aeruginosa*, and *Salmonella spp*. While the effect on Klebsiella was equal, on the other hand, the aqueous extract did not show any efficacy against *Proteus spp* as was shown in the results. The results also showed that *Staph. Aureus* bacteria were the most affected by the alcohol extract of the red pepper as it showed a high inhibition zone compared with the control sample tetracycline and nitrofurantoin. The plant’s aqueous and alcoholic red pepper extracts were effective against the tested bacterial isolates. The plant’s aqueous and alcoholic red pepper extract has good inhibitory efficacy against the studied bacterial isolates.

Key words: Red Pepper, Alcoholic extract, Aqueous extract, antagonism, Inhibition activity.

Introduction

Traditional medicine, including herbal medicine, is still widely practiced in most developing countries. Red pepper is the dried, ripened fruit pod from the *Capsicum* species’ pungent (hot) varieties. In addition to Cayenne, red pepper also goes by other names, including chili pepper, chile pepper, hot pepper, and red chilies. Pepper is one of the most important plants that have been used as medicine for a long time in different countries and civilizations. Because modern medicines such as antibiotics that previously enjoyed almost comprehensive adequacy against pathogens weaken their effectiveness.

The spread of resistant pathogens, manufactured medicines are one of the most severe problems that impede the success of treatments for diseases caused by germs. Since ancient times plant extracts and volatile oils have drawn attention as a source of natural products as they have shown their therapeutic power as an alternative for treating many infectious diseases. The effect of medicinal plants on the growth of microorganisms may lie in one of its components; it contains active substances, including volatile oils, glycosides, saponins, tannins, alkaloids, lipids, carbohydrates, resins, and steroidal compounds. Pepper has antimicrobial properties that are important for the human health of plants and antioxidant properties.

Studies have shown that they have anti-bacterial, antifungal, and antiviral properties. Research in the use of plant extracts and their active components as anti-bacterial agents, as the inhibitory effect of the active substances in these plants, is dilute and easy. Bodies can interact with them; in addition to that, they contain many active substances that work together to treat the disease, so it was used for many pathological symptoms. The World Health Organization (WHO) indicated that a large proportion of the world’s population primarily uses folk medicine in health care and medicine. It is worth noting that the world is now more inclined than before to treat herbs and medicinal plants after the results of the research have shown the effectiveness of treatment with them, and there has become a near-global race to register the most significant possible number of patents for the results of the research that is being conducted.

The present study aimed to isolate and diagnose different multiresistant Gram-positive and gram harmful bacteria and to study the effect of red pepper extracts on the isolated bacteria—the Comparison effect of watery and alcoholic pepper extract with several commonly used antibiotics.

Materials and methods

Sixty samples were collected from patients with various infections and pathological injuries from different areas of the body from Tikrit Teaching Hospital were placed directly after taking them in test tubes containing the sterile medium (Brain heart infusion broth), after which the tubes were transferred to the laboratory, incubated at 37 ° C for 24 hours in blood base agar and MacConkey media.

Bacterial isolates

Seven bacterial species were isolated from different parts of human bodies, and they confirmed that they are pathogenic bacteria. Nutrient Agar base and MacConkey Agar were incubated at 37 ° C for 24 hours.

Preparing plant extracts

The aqueous extract was prepared by mixing 40 grams of dry red pepper with 160 milliliters of sterile distilled water. While the alcoholic extract, mix 40 grams of the dry plant model with 160 milliliters of ethyl alcohol at a concentration of 95% to prepare the alcoholic extract, stir the mixture with a shaker device, and leave the mixture in the refrigerator for 24 hours. For soaking, filter using filter paper to get rid of unpowdered particles and fibers. After filtration, the extract is placed in the incubator at 40 °C until all liquids are evaporated and the extract remains in Baker’s base.

Sterilization of the alcoholic extract

It was prepared by dissolving 1 g of the plant extract in 5 cm³, sterilizing the mixture at a temperature of 62°C for 15 minutes, thus obtaining the standard center of the alcoholic extract used to prepare the subsequent dilution.

Diffusion test method

The methods included drilling a nutrient agar medium of equal dimensions with a diameter of 6 mm using the cork borer. 0.1 ml of the bacterial leeches is spread on the surface of the medium, and then the pits are filled with the extractor solution, and the plates are then incubated at 37 °C for 18 hours, then the extract’s effectiveness is evaluated. Inhibition on bacteria by measuring the diameter of the inhibition circuit.

Antibiotic sensitivity test

The method (Kirby Bauer)13 was followed to test the susceptibility of germs to the types of antibodies used prepared by the company (Bioanalyse) where (5-4) pure colonies of these germs were transferred to the medium of the nutritious broth and the bacterial cultures were immunized to a degree. 37 C for a period of (14 - 16) hours, then dilute the bacterial suspension with the physiological solution compared to the standard control tube, which is equivalent to 10 cells / cm³, then transfer 0.1 cm of the bacterial suspension to the medium of neutron agar and by using a cotton swab spread on the surface of the plate using a cotton swab left the dishes at a degree. The room temperature was set for 30 minutes, then the antibiotic tablets were fixed and using sterile forceps, the dishes were preserved for (14-16) hours, then the area of growth inhibition was measured by one millimeter14, and then the results were recorded.

In this study, samples were taken from patients suffering from pathological injuries and different body areas according to the area of injury shown in Table (1).

Diagnosis and identification

The bacterial colonies growing on media (McConkey agar and nutrient agar media) were identified through microscopy, culture characteristics, and biochemical tests, which included tests (catalase, oxidase, indole, red methyl, vox-Proskauer, Simmons citrate, motility, urease, Klingler iron agar test).

As for the tests for bacteria of the genus Staphylococcus included (catalase test, clotting test, growth on mannitol salt agar, oxidase and urease).

Results and discussion

The alcoholic extract showed higher inhibitory efficacy than aqueous on the growth of isolates of multiple antibiotic-resistant bacteria.

The aqueous extract of the red pepper plant showed good inhibitory efficacy against the studied microbial species, as it had the highest inhibitory action against E. coli, with the average diameter of the inhibition circle diameter 16.5 mm, and it is an excellent inhibitory when compared with the antibiotics Gentamicin and Nitrofurantoin as it showed good inhibitory efficacy against because this pepper contains a large number of fatty acids esters, amides, monoterpenes, diterpenes, triterpenes, sesquiterpenes, and phytosterols were shown in Sharma et al.16. It also exhibited significant antimicrobial activity against pathogenic microorganisms17. The bacteria S. aureus, P aeruginosa, and Salmonella. Sp. The results were identical to the results of Araujo et al.18. The results in the current study disagree with Soetarno et al.19 how tested the antimicrobial property of pepper and found ethanol extracted pepper was more effective than aqueous extracted.

The extract did not show any inhibitory efficacy against the bacterium Proteus. sp, while the alcohol extract showed the inhibitory activity against the bacterium itself. From the rates of inhibition diameters, the bacterium was found most affected by the alcohol extract of the plant, which showed High

Table 1. Shows the areas of bacterial isolation and the disease state isolated from them.
sensitivity inhibition when compared with the control sample tetracycline and nitrofurantoin as the results shown in the same Table showed that the alcoholic extract of the plant has inhibitory activity affecting the bacteria *E. coli*, *P. aeruginosa*, and *Streptococcus sp.* These results are similar to the results obtained by (20) Antimicrobial activity of ethanol extracts from different *Capsicum* against *S. aureus*, *Saccharomyces* was investigated by (14 and 21) and anti-bacterial activity of chili against *Bacillus subtilis* and *E. coli* was reported by De et al.22. The alcoholic extract of the red pepper plant was found to have inhibitory efficacy against many types of germs, and the *Klebsiella sp* bacterium was cleansed. The bacterial species was least affected by the aqueous and alcoholic extract of the plant; as the average diameter of the inhibition, the circuit was about 9.2 mm at a concentration of 200 mg/cm² bitter, which the substance’s inability can explain. The effective dissolved in water and alcohol to penetrate the biological envelope of the germ, as the reason for this may be attributed to its possession of medicine. The mucosal time (reduced) may give it an essential defensive factor that protects it from the inhibitory action of the active components of the extract23. Many researchers demonstrated the effect of plant extracts on bacterial inhibition1,2,24. The use of various compounds to inhibit pathogenic bacteria has been discussed in previous studies, such as the direct influence of Ag and TiO₂ nanoparticles on pathogenic bacteria such as *P. mirabilis* and *Proteus vulgaris* in a previous study25. However, several studies have discovered that applying physical forces therapy to pathogenic bacteria, such as Audible Sounds and Magnetic Fields, can help to reduce the resistance of *S. aureus* to infection26.

**Conclusiones**

The plant’s aqueous and alcoholic red pepper extracts were effective against the tested bacterial isolates. The highest inhibitory action of the plant’s aqueous red pepper extract was against *E. coli*, while there was no inhibitory effect against the bacterium *Proteus sp.*
